Dark circles & eyes tired look

RRS® HA EYES A NEW MEDICAL APPROACH FOR REJUVENATION OF THE PERIORBITAL AREA

Gabriel Siquier¹, Olga Liplavk¹ and Evgeniya Ranneva²

1-aesthetic medicine practitioner (The Netherlands) 2-Ph D, dermatologist (Spain)

RRS® HA Eyes is a new potential synergistic treatment for circles under the eyes and lymphedema. It is a medical device CE class III for injections into the tear trough area, palpebral malar groove and upper eyelid. The main medical proposal for this new therapeutic approach is to minimize side effects during long-term therapy, and be effective and save.

Introduction

Puffiness and dark circles under the eyes are very prevalent complaints in every day cosmetic practice and can be mistaken for tiredness and premature aging.

The most common treatment option in the periorbital area is with cross-linked Hyaluronic Acid and, therefore, it is important to be aware of the usual complications such as swelling by overcorrection, nodules and edema by compression of lymphatic system.

Material and methods

RRS® HA Eyes is a new potential synergistic treatment for circles under the eyes and lymphedema. It is a medical device CE class III for injections into the tear trough area, palpebral malar groove and upper eyelid. The main medical proposal for this new therapeutic approach is to be safe, minimize side effects during long-term therapy, and be effective.

Every ampoule of 1,5mL RRS® HA Eyes contains 5,0mg/mL of non-cross-linked HA associated with active biorevitalization solution (BS 27,3mg/mL) and helps improving the transport function of the actives from biorevitalization solution. The complex actives of BS are: antioxidants, flavonoids, saponins, polyphenols, peptides and trace element.

Results & conclusion

The results of the study indicate that injections of this product applied on the tear trough, the palpebral malar groove and also the upper eyelid area is a safe and effective treatment with minimum side effects. RRS® HA Eyes does not cause edema, has no overcorrection issues and neither tyndall effect. The best efficacy was observed in case of volume loss on the area of tear trough and palpebromalar groove combined with lymphedema.

Although the results of RRS® HA Eyes treatment are very satisfactory, they require further investigation.

RRS® HA Eyes treatment result before & after.

RRS® HA Eyes treatment result before & after.

Recommendation

RRS® Eyes must be used under appropriate aseptic conditions in an authorized clinic on healthy, disinfected skin.

Before the treatment

Before the treatment, the physician should inform the patient:

- about indications and effects
- the possibilities of the side effects (pain, redness, ecchymosis, stinging sensations and swelling, local inflammation, usually disappearing in 24 hours)
- check allergy test

Sensitive skins may benefit from application of an anaesthetic cream prior to the treatment

We recommend to have a consent signed by the patient.

After the treatment

- Avoid extreme temperatures
- Saunas - Hammam
- Direct exposure to sun or UV
- From next day make-up can be used

Contraindications:

Allergy to any of the ingredients. Patients presenting any skin alteration, skin disease, infections or sequelae of streptococcal infections. Patients taking immunosuppressants, undergoing corticotherapy, with autoimmune disease history, patients with uncompensated diabetes, acute joint rheumatics, repetitive angina, and endocarditis.

*No studies are available for use during pregnancy and breastfeeding or in case of treatment on children or minors under 18.
